

HTML Tables

Organizing Page
Layout and Displaying
Page Data

HTML Tables

- Tables are a way of organizing your pages and for displaying page data
- Are simple in the fact there are only a few html tags to know:
 - <table>
 - <tr>
 - <td>
 - <th>
 - <caption>
- Some other tags more for grouping and styling(not required in this course):
 - <colgroup> and <col>
 - <thead>, <tbody>, <tfoot>
 - If curious check out:
 - http://www.w3schools.com/tags/tag_colgroup.asp
 - http://www.w3schools.com/tags/tag_tbody.asp

Why Use Tables for Page Layout?

■ Advantages

- Fairly simple to layout pages
- Pre-dates Cascading Style Sheets (but will support them)
- Works across all browsers from the Web's inception (not really an issue anymore)

■ Disadvantages

- For page layout, designer must edit every page to alter site (does not cascade)
- Some effects not possible
- "dated" appearance (looks like the 1990s)
- HTML can become fairly complex

Table Tag - <table>

- Denotes the start of a table
- Supported attributes:
 - width : defines how wide you want the table to be on the page
 - encouraged use % instead (better scaling) of pixels (though they will work too)
 - align (left, center or right) defines alignment for whole table (NOT the content of the table)
 - bgcolor : describes the background colour for the table
 - border : takes a number which is the number of pixels wide you want the border to be
 - cellpadding : Specifies the space between the cell walls and contents
 - cellspacing : Specifies the space between cells
- Note: height attribute is not supported
 - though was originally
 - table content will dictate its height

Table Row Tags <tr>

- Defines the start of a row in a table
- Must exist inside <table> tags
- Supports attributes:
 - align : horizontal alignment: left, center, right, or justify
 - valign: vertical alignment: top, middle or bottom
 - bgcolor : will define a background color for the whole row

Table Data Tags <td>

- Defines the a cell in a table
- Must exist inside <tr> tags
 - (i.e. <td> exist inside <tr> exist in <table>)
- Supports attributes:
 - align : same as <tr>
 - width: column width sized to fit (pixels) or can specify size relative to parent element
 - valign: vertical alignment to top, middle or bottom of the cell
 - bgcolor : will define a background color for a single cell
 - colspan : takes a number representing the number of columns you want the cell to “span”
 - rowspan : takes a number representing the number of rows you want the cell to “span”

Table Header Tags <th>

- Defines the a “header”cell in a table
 - Similar to the <td> tag, except by default the header cell is bold’ed and center’ed
- Still Must exist inside <tr> tags
 - (i.e. <th> exist inside <tr> exist in <table>)

Table Caption Tag <caption>

- Give a caption for a table
- Must occur the next line after the <table> tag

```
<table>
  <caption>IT Courses</caption>
  <tr>
    <th>Course Code</th>
    <th>Course Title</th>
  </tr>
  <tr>
    <td>WEBD2201</td>
    <td>Web Development - Fundamentals</td>
  </tr>
  <tr>
    <td>MATH1100</td>
    <td>Mathematics for I.T.</td>
  </tr>
</table>
```

Course Code	Course Title
WEBD2201	Web Development - Fundamentals
MATH1100	Mathematics for I.T.

HTML Table Making Strategies

- Be sure to draw the table you are creating by hand, and number each cell
 - It is tough to know what you are working towards if you do not do this
- Be sure to turn your table borders on
 - This makes it easier to see if something is broken, and more importantly where is it broken
 - Turn them off (i.e. set them to “0”) when your table is set up correctly

Simple Table Example

```
<table border="1">  
  <tr>  
    <td>row 1, cell 1</td>  
    <td>row 1, cell 2</td>  
  </tr>  
  <tr>  
    <td>row 2, cell 1</td>  
    <td>row 2, cell 2</td>  
  </tr>  
</table>
```

Rendered in the browser as:

row 1, cell 1	row 1, cell 2
row 2, cell 1	row 2, cell 2

Uneven Number of cells

```
<table border="1">
  <tr>
    <td>row 1, cell 1</td>
    <td>row 1, cell 2</td>
    <td>row 1, cell 3</td>
  </tr>
  <tr>
    <td>row 2, cell 1</td>
    <td>row 2, cell 2</td>
  </tr>
  <tr>
    <td>row 3, cell 1</td>
  </tr>
</table>
```

Rendered in the browser as:

row 1, cell 1	row 1, cell 2	row 1, cell 3
row 2, cell 1	row 2, cell 2	
row 3, cell 1		

Spanning Cells

- To fix the uneven number of cells you can span cells
- Across columns
 - `colspan="n"`, where n is the number of columns
 - Reduce number of cells in row accordingly
- Across rows
 - `, where n is the number of rows`

`colspan="2"`

The diagram shows a 4x3 grid of cells. A horizontal arrow above the grid points from the first column to the third column, indicating that the first two columns are spanned by one cell. A diagonal arrow points from the bottom-left cell of the first column to the top-right cell of the second column, indicating that these two cells are spanned by one row.

`rowspan="2"`

Colspan and Rowspan

- When you “span” multiple rows and columns with the rowspan and colspan attributes on a cell(ie. the<td> tags)

```
<table border="1" width="100%">  
    <tr>  
        <td width="20%">r1c1</td>  
        <td width= "70%">r1c2</td>  
        <td width="10%">r1c3</td>  
    </tr>  
    <tr>  
        <td>r2c1</td>  
        <td colspan="2" rowspan="2">row 2, cell 2</td>  
    </tr>  
    <tr>  
        <td>r3c1</td>  
    </tr>  
</table>
```

r1c1	row 1, cell 2	r1c3
r2c1	row 2, cell 2	
r3c1		

Width Attributes

- The browser will give equal shares to each column in the table unless you specify something else
- You can use width attribute to set column widths using:
 1. Percentages (recommended for scalability) or
 2. Pixels (not recommended)
- Try to have your percentages add up to 100%

Colspan and Rowspan

- You can “span” multiple rows and columns with the row and colspan attributes on a cell (`<td>` tags)

```
<table border="1">
  <tr>
    <td width="20%">row 1, cell 1</td>
    <td width="70%">row 1, cell 2</td>
    <td width="10%">row 1, cell 3</td>
  </tr>
  <tr>
    <td>row 2, cell 1</td>
    <b><td colspan="2" rowspan="2">row 2, cell 2</td></b>
  </tr>
  <tr>
    <td>row 3, cell 1</td>
  </tr>
</table>
```

row 1, cell 1	row 1, cell 2	row 1, cell 3
row 2, cell 1	row 2, cell 2	
row 3, cell 1		

Layout

- Create a paper design
 - “Master plan”
 - Divide page into rectangular cells
 - Subdivide cells with nested tables
- Create table HTML code as a shell
 - Indent table, tr and td elements for clarity
 - Add content later
 - Use validator to check for missing closing tags

Nesting Tables

- Entire table may appear inside a
an existing table <td> element
- NOTE: the code can get messy
 - Use indentation to structure HTML
code
 - Make sure all elements have closing
tags

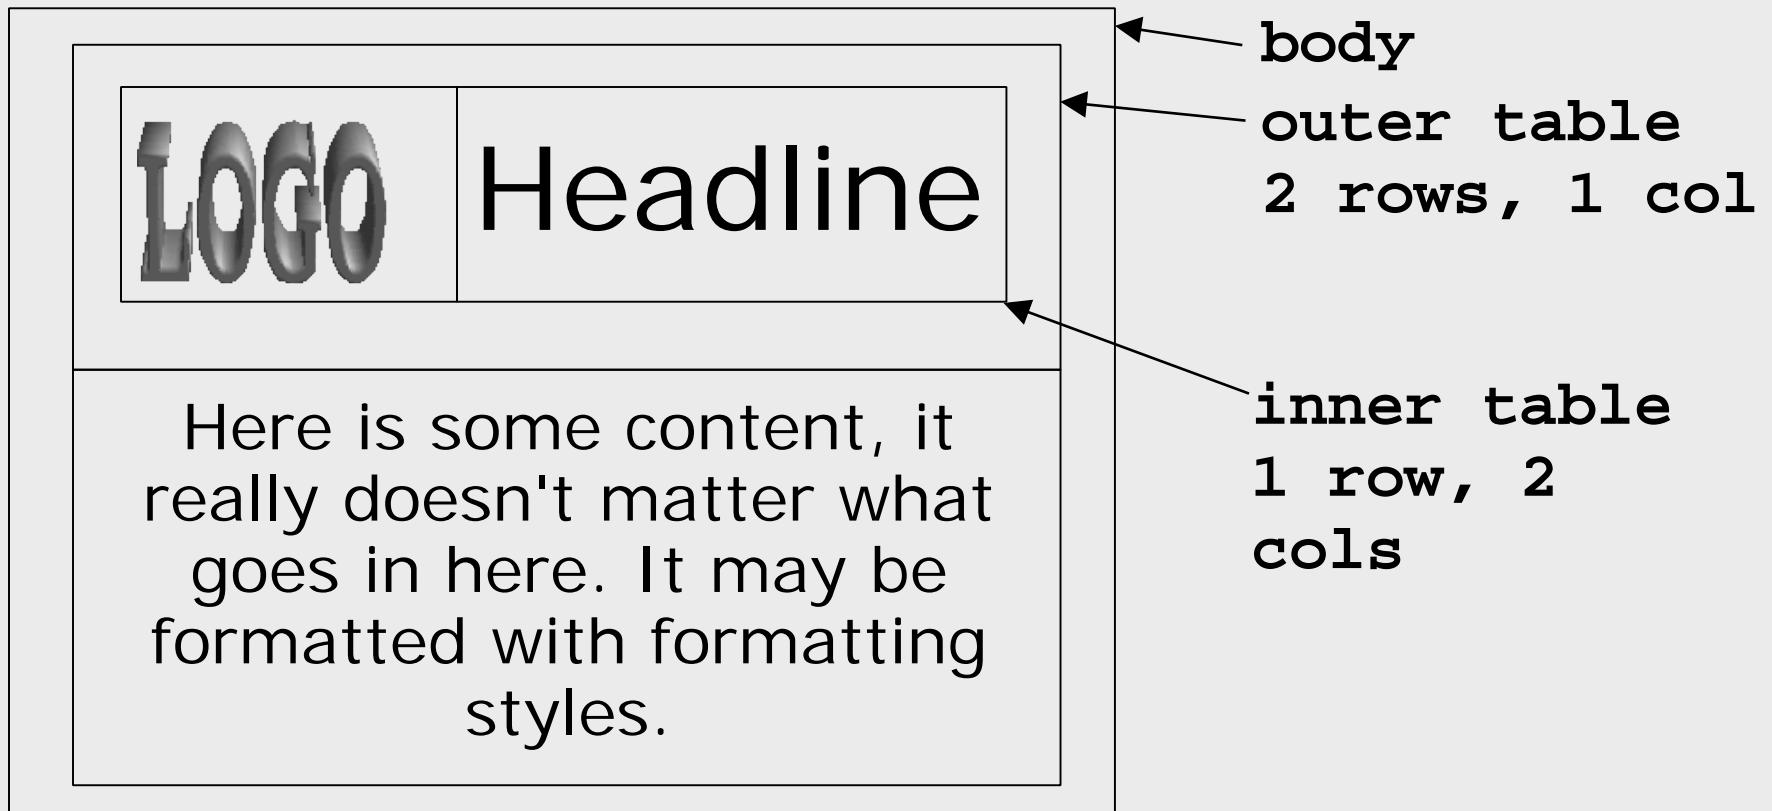

Nested Tables

```
<td>  
  <table border="0" cellpadding=0  
         cellspacing=0>  
    <tr>  
      <td></td>  
    </tr>  
    <tr>  
      <td align="center">Norwegian Blue  
        (lovely plumage)</td>  
    </tr>  
  </table>  
</td>
```

td tags
for outer
table

Layout with tables

- Create page layout using nested tables

Check out w3schools

- W3schools.com is an excellent resource for tables as well
- Check out:
 - http://www.w3schools.com/tags/tag_table.asp
 - See the examples section at the bottom of the page
